Scope of Work

The scope of work covers the design, development, and deployment activities for the complete platform.

Hospital Admin Features (Web App)

1. Admin Dashboard

- Access the Hospital Admin Dashboard to oversee all operational tasks by filling the provided login credentials by super admin.
- There will be forgot password feature with password recovery process through registered email.
- The Dashboard will display the main menu options with the following statistics:
  - Patient Overview:
    - Total number of inpatients (IP) and outpatients (OP).
    - Number of new vs. revisits.
    - Walk-ins vs. scheduled appointments.
  - Room & Bed Availability:
    - Number of occupied vs. available beds.
    - Room assignments for IPs and OPs.
  - Appointments:
    - Upcoming appointments.
    - Doctor availability and assignments.
  - Financial Overview:
    - Total revenue and pending payments.
    - Outstanding dues and payments received.
  - Resource Usage:
    - Critical resources in use (e.g., operating theaters, ventilators, oxygen cylinders).

- Staff Management:
  - Active staff members and user roles.
  - Pending approvals for user additions, deletions, or modifications.

2. User Management

- Registering New Staff (Doctors, Patients, Admins)
  - Click on "Add New User": Choose the role (Doctor, Patient, Staff) and complete the required fields (e.g., Name, Contact Information, Role).
  - Save & Assign Permissions: Assign roles (e.g., Admin, Doctor, Front Desk) and specify permissions.
  - Notify User: Send an email or SMS with login credentials and instructions.
- Deactivating/Removing Users
  - Navigate to User Management: Search for the user (by name or ID).
  - Deactivate or Remove User: Select the user and deactivate or remove them from the system.
  - Audit Logs: Track all deactivations or removals in the audit logs for compliance.
- User Password Management
  - Reset Password: Select a user from the list and reset their password. The system sends a temporary password via email.
  - Audit Login Activity: View logs of all login attempts, successful and failed, for tracking suspicious activity.
- Assigning Patients to Doctors (Front Desk Functionality)
  - View Doctor Availability: Check doctor availability and assign patients accordingly.
  - Record Patient-Doctor Assignment: The system automatically records the patient assignment in the doctor's schedule.
- Viewing Patient Feedback & Complaints
  - Access Feedback Section: View feedback and complaints submitted by patients or hospital staff.

- Escalate Issues: If necessary, escalate unresolved complaints to the relevant department or higher authority for follow-up.

3. Patient & Appointment Oversight

- Patient & Appointment Overview Dashboard
  - View Patient Overview: Monitor real-time data on inpatients (IP) and outpatients (OP).
  - Track New vs. Revisit Patients: See the number of new outpatients versus returning patients.
  - Monitor Appointments vs. Walk-ins: View appointment schedules and track walk-ins.
- Managing Hospital Capacity & Rooms
  - View Bed Availability: Access information on the number of active beds and available rooms.
  - Update Bed/Rooom Information: Add or update bed/room availability based on current capacity.
  - Assign Patients to Rooms: Allocate patients to available rooms based on their condition and doctor assignment.
- Accessing Patient Medical History
  - View Patient History: Access and review a patient's complete medical history in read-only mode, including diagnosis, treatment history, and lab results.
- Tracking Pending Tests & Reports
  - Monitor Test Requests: View pending tests for each patient and track progress.
  - View Test Results: Once results are uploaded, review them and assign them to the relevant doctors for review and action.

4. Capacity & Resource Management

- Service Tariffs & Pricing Setup

    - Configure Service Tariffs: Set or update tariffs for consultations, surgeries, rooms, labs, and radiology services.
    - Manage Pricing for Services: Edit or add pricing for medications, lab tests, and medical services.
- Approving Bills, Discounts, and Refunds
    - Bill Approval: Review and approve bills generated by doctors or the front desk.
    - Apply Discounts/Refunds: Authorize discounts or process refunds based on predefined criteria.
- Monitoring Hospital Resources
    - Track Critical Resources: Monitor resource usage, including operating theaters (OTs), ventilators, and oxygen cylinders.
    - Inventory Management: Ensure availability of critical resources and take action if resources are low.
- Insurance & TPA Management
    - Manage Insurance Policies: Track insurance claims, approvals, and reimbursements.
    - Process Third-Party Claims: Monitor and approve claims through third-party administrators (TPAs).

5. Financial Oversight Flow

- Financial Reports Generation
    - Generate Reports: Generate daily, weekly, monthly, and yearly performance reports based on hospital activities and department-wise revenue.
    - Track Payment Plans: Monitor pending patient payments, due amounts, and payment plans.
- Doctor Productivity & Revenue Monitoring
    - Monitor Doctor Performance: Track the productivity of doctors and their contribution to the department's revenue.

- Revenue Analysis: View reports that break down revenue by departments, services, and patient categories.

- Approving Vendor Purchases
  - Review Vendor Purchases: Approve purchases made by the pharmacy, lab, or maintenance department.
  - Track Supplier Purchases: Monitor suppliers for medication, medical equipment, and consumables.

6. Compliance & Security Flow

- Data Access Logs & Review
  - Audit Data Access: Review who accessed patient or administrative data, and at what time.
  - Compliance Checks: Ensure that all data access is compliant with privacy regulations (ABDM, ABHA).
- Patient Consent & Privacy Management
  - Manage Digital Consent Forms: View and manage patient consent forms. Allow patients to sign and revoke consent digitally.
  - Track Legal Holds: Ensure all relevant legal holds for patient records are maintained.
- Compliance Document Management
  - Licenses & Certifications: Ensure that all necessary hospital certifications and licenses are updated and compliant.
  - Audit Trails: Maintain exportable audit trails for legal and regulatory compliance.

Doctor Features (Web App)

1. Doctor Login & Dashboard Access

- Login:

- The doctor logs into the system using secure credentials (username/password).

- Dashboard Overview:
  - The doctor is presented with a customized dashboard, providing quick access to:
    - Upcoming appointments.
    - Patient queue (e.g., checked-in, waiting, in consultation).
    - Alerts and notifications for urgent tasks (e.g., lab results, ticket requests).
    - Recent progress notes or patient updates.

2. Access Patient Demographics

- Patient Search:
  - The doctor can search for a patient by name, patient ID, or appointment date.
- View Demographics:
  - On opening a patient's profile, the doctor can view detailed demographics such as:
    - Name, phone, gender, age, weight, blood pressure (BP), etc.
- Patient History Access:
  - The doctor can view:
    - Previous visits (date, reason, diagnosis).
    - Past prescriptions, test results, and medical conditions.

3. Calendar & Appointment Management

- Calendar View:
  - The doctor has access to a daily/weekly calendar that displays scheduled appointments and walk-ins.
    - Appointments: Appointments with confirmed time slots.
    - Walk-ins: Unscheduled patients seeking consultation.

- Manage Queue:
  - Doctors can manage the patient queue by updating statuses such as:
    - Checked-in.
    - Waiting.
    - In consult.

4. Patient Profile Management

- Read-Only Profile:
  - Doctors can access patient profiles but can only view data (read-only) unless they are making updates (e.g., in progress notes).
- Raise Tickets:
  - Doctors can raise tickets (e.g., OP to IP requests) with relevant details (reason, attachments).
    - Tickets can be escalated or flagged for attention from admins.
- Patient Transfer:
  - Doctors can transfer patients to other doctors within the system by initiating a transfer request.
- Initiate OT Requests:
  - If surgery is required, the doctor can initiate an OT transfer request:
    - Procedure details.
    - Urgency.
    - Preferred time.
    - Required equipment and pre-op checklist.

5. Progress Notes Management

- Adding Progress Notes:
  - Doctors can manage detailed progress notes for patients, including:
    - Complaints: Chief complaints reported by the patient.
    - Vitals: Blood pressure, temperature, weight, etc., updated by both front desk and doctors.

        - Investigations: Tests and procedures ordered.
        - Discussions, Impressions, Advice: Notes on diagnosis and treatment plans.
- Auto-Updates for OP & IP:
    - For OP patients: Progress notes are auto-filled after 24 hours.
    - For IP patients: Progress notes remain active until discharge and are updated throughout the day.
- Pinning to Discharge Summary:
    - Every note has a checkbox to "Pin to Discharge Summary".
        - Doctors can click "Prepare Discharge Summary" to generate a draft from the progress notes.

6. Discharge Summary Preparation

- Generate Draft Discharge Summary:
    - The system automatically generates a draft discharge summary with the following information:
        - Patient demographics and admission/discharge details.
        - Diagnoses from coded entries.
        - Procedures performed (from logs and records).
        - Key Labs/Imaging results.
        - Medication Reconciliation based on prescriptions.
- Finalization & E-Sign:
    - The doctor reviews the draft, clicks "Sign & Finalize", and completes the e-signature for legal validation.
- Patient Access:
    - The discharge summary is automatically published to the Patient Portal and made available for download as PDF.

7. Medication & Drug History

- Current Medication:

- Doctors can view and update the list of current medications a patient is taking. This section is editable by the doctor and viewable by both the doctor and patient.

- Drug History:
  - The system maintains a record of all past and current prescriptions for the patient.
    - OP and IP prescriptions are fully automated and tracked.

8. Patient Medical Records

- Personal History:
  - Doctors can edit sections such as:
    - Appetite, diet, sleep patterns, and disorders.
- Family History:
  - Patients can edit their family medical history, including hereditary disorders, categorized by maternal/paternal side.
- Drug and Food Allergies:
  - Both doctor and patient can update and view drug and food allergies.
- Investigation Reports:
  - Doctors can view prescribed tests and uploaded results from labs. They can edit prescriptions, but labs cannot edit results.
- Miscellaneous Records:
  - Patients can upload external documents (e.g., previous medical reports), which are accessible by the doctor.

9. Communication & Notifications

- Receive SMS Notifications:
  - Doctors receive SMS notifications for urgent patient updates, lab results, and ticket requests.
- Searchable Q/A Help Section:

- Doctors can access a searchable Q/A help section to find answers to common clinical and system-related queries.

10. Editing Personal Information

- Edit Credentials:
  - Doctors can edit their credentials (e.g., qualifications) and contact information within the system.

11. Final Actions & Task Completion

- Review & Finalize:
  - After completing tasks such as progress notes, prescriptions, and discharge summaries, doctors finalize and sign off on their actions.
- Patient Interaction:
  - Doctors can communicate securely with patients through the system (for appointment confirmations, treatment clarifications, etc.).

Patient Features (Mobile & Web App)

1. Patient Account Creation & Login

- Self-Signup or Front Desk Registration:
  - Patients can self-register through the portal or app, providing essential information such as name, contact details, and emergency contact.
  - Alternatively, front desk staff can create an account for the patient by entering basic details into the system.
- Two-Factor Authentication (2FA):
  - After account creation, patients are prompted to enable two-factor authentication (2FA) for additional security when logging in.
- Login:

- Patients log into their account using their username and password, with an additional OTP (One-Time Password) sent via SMS or email (if 2FA is enabled).

2. Profile Management & Data Access

- Access to Medical History:
  - The patient has read-only access to their medical history (e.g., past diagnoses, treatments, lab results).
  - Editable Fields:
    - The patient can update certain fields like personal history, family history, allergies, and miscellaneous medical records.
    - Editable Profile Information: Patients can update basic personal details such as name, contact number, address, and blood group.
- Protected Data:
  - Family history, personal history, and allergies are protected, meaning they cannot be deleted. They can only be edited or updated as necessary.

3. Appointment Management & Communication

- Ticket System for Appointment Requests:
  - Patients can submit appointment requests via the system using a ticketing system. The system generates a unique ticket ID, and the patient can track the status of their request (open, pending, closed).
- Appointment Management:
  - Patients can view, cancel, or reschedule appointments based on availability. Notifications are sent for appointment confirmations, cancellations, or changes.
- Secure Messaging with Doctor:
  - The patient can message their assigned doctor directly through the platform for clarifications, treatment updates, or inquiries. All communications are secure and encrypted.

4. Data Privacy & Notifications

- Consent Management UI:
  - Patients can view and manage consent forms, including viewing, revoking, or accepting new consents. Consent management includes tracking the dates when consent was given or revoked.
- Privacy Settings & Notifications:
  - Patients can set privacy preferences for their data (e.g., who can access their medical records) and customize notification settings (e.g., appointment reminders, medical updates).
- Receive Data Deletion Notifications:
  - If certain data (e.g., medical history, personal details) is set for deletion, patients receive notifications at least 6 months in advance to allow them time to review or download their records.

5. Billing, Payments, and Document Management

- View Billing History & Download Invoices:
  - Patients can view their billing history, including consultation fees, medication costs, lab tests, and room charges. They can download invoices for each service or treatment received.
- Hospital & Pharmacy Bills:
  - The patient can view and download their hospital and pharmacy bills, which include a detailed breakdown of the charges.
- Feedback:
  - Patients have the option to provide feedback on their hospital experience, including interactions with doctors and the overall care they received. This feedback is stored in the system for review by hospital management.
- Download Medical Documents:

- Patients can download all relevant documents (e.g., prescriptions, discharge summaries, test reports) in PDF format for offline reference or printing.

6. Family & Emergency Management

- Family History Tagging:
  - The patient's family history (e.g., hereditary diseases) is tagged as either maternal or paternal. Alerts are set for doctors to view the family history when applicable.
- Emergency Contact/Next-of-Kin:
  - Patients can capture emergency contact details (name, relationship, contact number), which can be accessed by doctors and hospital staff in case of emergencies.

7. Document & Summary Export

- Export Full Medical Summary:
  - Patients can export their full medical summary as a PDF or JSON document, which includes all their health records, prescriptions, visit history, and test results.
- Audit Logs of Access:
  - Patients have the ability to view a detailed audit log of who has accessed their data, when, and for what purpose. This ensures transparency and compliance with privacy regulations.

8. Patient Interaction with Hospital Services

- Track Ticket Status:
  - The patient can track the status of their appointment requests, ticket submissions (e.g., complaints, queries), and other service requests in real-time.

- View Registered Hospitals:
  - Patients can view a list of registered hospitals and choose the ones they are associated with. This helps patients access the right location and service providers.
- Basic KYC Verification:
  - The system includes a basic Know Your Customer (KYC) verification flow that ensures the patient's identity is confirmed through government IDs or other documents.

9. Notifications & Updates

- Receive Real-Time Notifications:
  - The patient receives real-time notifications for various events, such as:
    - Appointment confirmations, cancellations, and reminders.
    - Updates on prescription status and lab results.
    - Alerts for data access and changes made to their records.
- Set Preferences for Notifications:
  - Patients can configure their notification preferences based on their needs. They can choose to receive alerts via SMS, email, or app push notifications.

Lab User Features (Web App)

1. Lab Login & Dashboard Access

- Login:
  - Lab users (technicians, pathologists, radiologists, and administrators) log into the system securely using username and password or two-factor authentication (2FA).
- Dashboard Overview:
  - Upon login, the lab user is presented with a dashboard showing:
    - New and pending orders.

- Sample status updates.
- Recent reports ready for publication or review.
- Notifications for completed tests and upcoming imaging requests.

2. Order Intake

- Doctor Orders:
  - Doctors place test orders via the system (either for the lab or third-party lab).
  - The system routes the order to the relevant lab department (e.g., chemistry, pathology) or third-party partner.
- View Test Orders:
  - Lab users can view the test orders along with patient demographics (name, age, contact details) for each sample.
  - The order details include test type, urgency, and requested results.

3. Sample Collection & Tracking

- Sample Collection Update:
  - Technicians collect the sample and update the sample status in the system (e.g., "collected," "in transit," "received").
  - Courier Integration: If necessary, the system integrates with courier services for sample transport tracking.
- Sample Status Updates:
  - Lab technicians update the status regularly to reflect the sample's journey through the lab (e.g., "in progress," "completed," "cancelled").
  - The system provides real-time visibility to doctors and patients regarding the status of the sample.

4. Analysis & Result Entry

- Result Entry:

- After the analysis is complete, technicians or lab supervisors enter test results into the system, ensuring that results are recorded in the correct format.
- The system validates the data to ensure consistency and correctness (e.g., numeric fields for blood tests, urine analysis, etc.).

- Supervisor Review:
  - A supervisor reviews the entered results, ensuring accuracy before final approval.
  - If needed, the supervisor can make corrections to the data before finalizing the results.

5. Report Generation & Publication

- Report Creation:
  - Once the test results are validated and approved, the report is generated. This includes:
    - Hospital branding (hospital logo, contact details).
    - Structured numeric fields for test results.
    - Secure QR code for verifying the authenticity of the report.
- Report Review and Sign-off:
  - Pathologists (or relevant authorized personnel) review the report and sign it off electronically using the system.
- Report Publication:
  - Once signed off, the report is published to the patient's EMR (Electronic Medical Records).
  - Notifications are sent to the doctor and patient via SMS or email to inform them that the report is available.

6. Corrections & Re-Issues

- Correcting Reports:

- If any mistakes are identified post-signoff, the lab supervisor can make corrections to the report.
- The system tracks version history to maintain an audit trail of changes made.

- Re-Issuing Reports:
  - After corrections, the revised report is sent to the patient and doctor. Notifications are sent to inform them of the update.
  - The system updates the patient's EMR to reflect the corrected version.

7. Imaging Requests (Radiologists)

- Imaging Requests from Doctors:
  - Doctors can place imaging requests (e.g., X-rays, MRIs, CT scans) via the system.
- Manage Imaging Schedules:
  - Radiologists or imaging technicians can schedule and track imaging procedures based on doctor requests and resource availability.
- Upload Imaging Results:
  - Once the imaging procedure is complete, radiologists upload structured reports to the system, including:
    - Images (e.g., X-ray films, MRI scans).
    - Radiology reports with interpretations and findings.
- Integration with PACS/DICOM:
  - The system integrates with PACS (Picture Archiving and Communication System) and DICOM (Digital Imaging and Communications in Medicine) to ensure seamless uploading and viewing of medical images.

8. Link Results to Patient EMR

- Link Imaging Results:
  - Once the imaging reports are uploaded, the results are linked to the patient's EMR for easy access by doctors and the patient.

- Accessing Test Results:
    - Doctors can access both test results and imaging reports from the patient's EMR, ensuring that all data is centralized for efficient treatment planning.

9. Billing & TPA Linkage

- Automatic Billing:
    - Billing for lab services is automatically linked to the patient's account, based on the tests performed.
    - The system calculates the cost of each test and adds it to the patient's billing history.
- Third-Party Administration (TPA) Integration:
    - For insured patients, the system links billing directly to the TPA for claims processing.
    - Insurance claims are processed automatically, ensuring that billing is accurate and up-to-date.

10. Reporting & Analytics

- Generate Radiology Reports:
    - The system generates reports that provide insights into radiology usage (e.g., frequency of X-ray use, MRI TAT (Turnaround Time)).
- Track TAT:
    - The turnaround time (TAT) for imaging tests and lab results is tracked, ensuring that procedures are completed within acceptable timeframes.
- Search and Filter:
    - The lab system offers search and filter functionality for technicians and doctors to easily retrieve past test results and imaging reports.

11.Audit & Compliance

- Maintain Audit Logs:
  - Every action taken within the lab system (e.g., report generation, result entry, corrections, access to patient records) is logged for compliance and audit purposes.
  - The audit logs can be accessed by administrators to track any changes or accesses to sensitive data.

Nurse User Features (Web App)

1. Nurse Login & Dashboard Access

- Login:
  - Nurses log into the system with secure username and password or two-factor authentication (2FA).
- Dashboard Overview:
  - Upon logging in, nurses are directed to a customized dashboard that provides:
    - Patient list (assigned patients, ward, and bed details).
    - Current tasks (medication administration, patient vitals, follow-ups).
    - Shift roster and handover tasks.
    - Vital trends and alerts for patients requiring immediate attention.

2. Patient Management

- Admit & Discharge Patients:
  - Nurses can admit patients by entering demographic data and contact information. They can also discharge patients after completing the required formalities and providing necessary discharge materials.
- Update Patient Data:

- Nurses can update patient demographics, contact information, and assigned ward and doctor in real time.

- Search Patients:
  - Nurses can search for patients by ward, bed number, or patient name to easily retrieve their profiles and treatment history.
- View Assigned Doctor & Notes:
  - Nurses have quick access to the assigned doctor's details, patient notes, and relevant clinical information.

3. Clinical Charting

- Record Vitals:
  - Nurses can record patient vitals (e.g., temperature, pulse, BP) with timestamped entries. These records are automatically updated in the patient's profile for doctor review.
- Add Nursing Notes:
  - Nurses can add nursing notes and observations (e.g., changes in the patient's condition, emotional state, or care requirements).
- Document Wound Care & IV Lines:
  - Nurses document wound care, IV line placements, and intake/output details to monitor and update treatment progress.
- View Vital Trends & Alerts:
  - Nurses can view trends of patient vitals and receive alerts for abnormal readings (e.g., high BP or low oxygen levels) that require immediate attention.

4. Medication Administration (eMAR)

- View Medication Schedule:
  - Nurses can access the medication schedule for their assigned patients, which shows when each medication should be administered.
- Record Medication Administration:

    - Nurses record each administration, including doses and times, and track missed doses or PRN (as needed) medications.
- Track Allergies & Interactions:
    - Nurses can view allergy alerts and medication interaction warnings before administering any drug, ensuring patient safety.

5. Orders Execution

- Acknowledge Doctor Orders:
    - Nurses acknowledge orders from doctors, such as medication, tests, or other treatments, ensuring that they are carried out promptly.
- Sample Collection Updates:
    - Nurses update the status of sample collection (e.g., "sample collected," "sample in transit," "sample received") to ensure timely processing.
- Follow-Up on Pending Requests:
    - Nurses monitor pending requests (e.g., tests, medications) and follow up to ensure they are processed without delay.

6. Shift Reports & Handover

- Per-Shift Handover Notes:
    - Nurses add handover notes at the end of their shift, ensuring that the incoming nurse is aware of any outstanding tasks, patient status, or special instructions.
- Generate Structured Checklists:
    - Nurses can generate checklists for routine tasks (e.g., medication administration, patient rounds) to ensure nothing is overlooked.
- View Shift Roster & Mark Handover Complete:
    - Nurses can view the shift roster, mark handover complete, and ensure all tasks are transferred to the next nurse.

7. Bed & Ward Management

- Track Bed Availability:
  - Nurses have access to a real-time view of bed availability across the hospital, ensuring that patients are admitted to appropriate wards.
- Request Patient Transfers:
  - If required, nurses can request patient transfers between wards or beds, ensuring that the patients are assigned the right care.
- View Ward Occupancy Dashboard:
  - Nurses can view a dashboard that provides an overview of ward occupancy, helping them manage patient allocation more efficiently.

8. Consent & Documentation

- Assist with Consent Forms:
  - Nurses help upload, verify, and manage consent forms, ensuring that patients sign necessary documents (e.g., surgical consent, treatment consent) as per hospital protocols.
- Generate Basic Certificates:
  - Nurses can generate basic certificates, such as sick leave certificates or discharge certificates, as needed by patients.

9. Reporting & Incident Management

- Request & Track Equipment:
  - Nurses can request equipment needed for patient care (e.g., medical devices, monitors) and track equipment usage.
- Log Equipment Faults:
  - If there are any issues with equipment, nurses can log faults and escalate them to the maintenance team for repair.
- Log Adverse Events & Escalation:

    - Nurses can log adverse events (e.g., patient falls, medication errors) and escalate urgent issues to the medical team for immediate action.
- Track Incident Resolution:
    - Nurses track the resolution of any incidents or issues they log, ensuring timely action and proper documentation for compliance purposes.

10.Patient Education & Discharge

- Provide Discharge Materials:
    - Before discharge, nurses provide education materials to patients, including post-discharge care instructions, medication guidelines, and recovery tips.
- Patient Education:
    - Nurses ensure that patients understand their care plan, discharge instructions, and follow-up appointments.

11.Inventory & Ward-Level Management

- View Stock of Critical Meds & Consumables:
    - Nurses can view inventory levels for critical medications and consumables (e.g., bandages, IV fluids) within their assigned ward.
- Raise Supply Requests:
    - Nurses can raise supply requests for any missing or low inventory items to ensure continuous patient care.
- Track Inventory Usage for Billing:
    - Nurses track the usage of medications and consumables to ensure they are properly billed to patients.

12.Reports & KPIs

- Generate Shift Summaries:

- At the end of each shift, nurses can generate shift summaries, providing a comprehensive overview of their activities, patient status, and completed tasks.

- Track Turnaround Times (TAT):
  - Nurses monitor turnaround times (TAT) for key hospital services (e.g., lab tests, imaging).
- Personal Task Dashboards:
  - Nurses have access to personal task dashboards that track their daily activities, performance, and pending tasks.

Front Desk User Features (Web App)

1. Front Desk Login & Dashboard Access

- Login:
  - Front desk user log into the system with secure username and password.
- Dashboard Overview:
  - Upon logging in, front desk are directed to a customized dashboard that provides:
    - Patient list (assigned patients, ward, and bed details).
    - Current tasks (appointment pending, cancelled, completed).

2. Patient Registration

- Create New Patient Profile:
  - Enter Basic Information: Front desk staff enters patient details such as name, contact number, gender, date of birth, etc.
  - Generate MRN: The system automatically generates a Medical Record Number (MRN) for the new patient.
  - Capture Photo & ID Proof: Upload the patient's photo and ID proof for verification and record-keeping.

- Record Emergency Contacts: Add emergency contact details (name, relationship, phone number) to the patient's profile.

- Update Demographics for Returning Patients:
  - Search for Existing Patient: Search for the patient using their MRN or name.
  - Update Profile: Modify any demographic details (e.g., address, contact information) as necessary.

3. Appointment Management

- Book an Appointment:
  - Select Doctor & Specialization: Choose a doctor based on specialization and availability.
  - Check Doctor Availability: View the doctor's calendar for open slots (daily, weekly).
  - Select Appointment Date & Time: Book a date and time that suits the patient.
  - Confirm Appointment: Confirm the appointment by entering patient details (if new) or selecting from existing profiles.
  - Send Appointment Confirmation: Automatically send SMS/email confirmation to the patient with appointment details.
- Reschedule or Cancel Appointment:
  - Search Appointment: Use the MRN or appointment ID to find existing appointments.
  - Reschedule: Select a new time slot from the available options and update the appointment.
  - Cancel Appointment: If the patient cancels, select "Cancel Appointment" and notify the patient via SMS/email.
- Appointment Reminder:
  - Send automatic reminders (SMS/email) a day before or on the day of the appointment.

4. Walk-In Queue Management

- Issue Queue Tokens:
  - Capture Patient Details: For walk-in patients, collect basic patient information (name, contact) and provide a unique queue token.
  - Track Patient Status: Update the patient status as they progress (e.g., "Checked-in," "Waiting," "In consultation").
- Manage Walk-In Patient Status:
  - Update Status: Change the patient's status based on their progress in the queue (e.g., from "Waiting" to "In Consultation").
  - Alert Medical Team: Notify the assigned doctor when the patient is ready for consultation.

5. Billing & Receipts

- Collect Consultation Fees:
  - Generate Invoice: After the appointment is booked, generate an invoice for consultation services based on the doctor and service type.
  - Accept Payment: Collect the consultation fee using various payment methods (e.g., cash, credit/debit card, online payment).
- Generate Receipts:
  - After payment is received, generate a receipt with a unique transaction ID.
  - Send Receipt: Provide the patient with a printed receipt or send it via email/SMS.

6. Admission Initiation

- Capture Ward Preferences & Admission Details:
  - Patient Admission Request: For patients requiring admission, capture their preferred ward, admission date, and deposit amount.

- Generate Admission Slip: The system generates an admission slip with the patient's details, ward assignment, and checklist (necessary documents, instructions).

- Generate Admission Checklist:
  - Create a checklist for the patient's admission, including:
    - Ward assignments.
    - Documents required (e.g., ID proof, consent forms).
    - Deposit details.

7. Document Upload & Verification

- Upload Referral Letters & Medical Documents:
  - Scan & Upload Documents: Scan and upload referral letters, medical reports, and ID proof into the system.
  - Flag Missing Documents: If any required documents are missing, flag them in the system for follow-up.
- Verify Documents:
  - Ensure Completeness: Verify the uploaded documents to ensure they meet hospital requirements.
  - Alert for Missing Documents: Notify the patient if any documents are missing before proceeding with treatment.

8. Notifications & Status Management

- Trigger SMS/Email Notifications:
  - Send notifications to patients for:
    - Appointment reminders (before the scheduled time).
    - Queue updates (e.g., status changes, appointment confirmations).
    - Admission confirmation (details of ward and admission slip).

9. Day-End Closure

- Generate Daily Summaries:

- At the end of the day, generate daily summary reports that include:
  - Total number of admissions.
  - Appointments scheduled and completed.
  - Walk-in patient statistics.

- Reconciliation Reports:
  - Generate reconciliation reports for payments received, ensuring all fees are accounted for and receipts match.

10.Audit & Role Checks

- Maintain Logs of Edits & Uploads:
  - The system automatically logs all edits made by front desk staff (e.g., patient data updates, document uploads) for audit purposes.
- Configurable Permissions:
  - Role-based permissions allow front desk staff to have configurable access, ensuring that only authorized users can make specific changes (e.g., billing, document verification).

Pharmacy User Features (Web App)

1. Pharmacy Login & Dashboard Access

- Login:
  - Pharmacists and pharmacy staff log into the system using secure username and password or two-factor authentication (2FA).
- Dashboard Overview:
  - Upon logging in, pharmacists are presented with a dashboard that provides:
    - Pending prescriptions to be filled.
    - Low stock alerts and expired drugs.
    - Drug inventory levels (e.g., quantity available, upcoming expiry).
    - Sales and usage statistics.

2. Receive Prescriptions from Doctors

- Prescription Receiving:
  - Pharmacists receive prescriptions directly from doctors through the system. This can include:
    - Electronic prescriptions (e-prescriptions).
    - Manual prescriptions uploaded or scanned into the system.
- View Prescription Details:
  - Pharmacists can view detailed prescription information, including:
    - Patient details (name, ID, etc.).
    - Medication name, dosage, frequency, and duration.
    - Doctor's instructions and special notes.

3. Maintain Hospital Drug Formulary

- Update Drug Formulary:
  - The pharmacy team maintains the hospital drug formulary, which includes:
    - List of approved medications for treatment.
    - Drug categories (e.g., antibiotics, painkillers, etc.).
    - Pricing and availability status for each drug.
- Add New Medications:
  - Pharmacists can add new medications to the formulary, updating information such as:
    - Drug name.
    - Supplier details.
    - Cost and manufacturer.
    - Indications and contraindications.

4. Dispense Medicines & Stock Deduction

- Dispense Medication:

- When a patient comes to pick up medication, the pharmacist:
    - Searches for the prescription (using patient ID or prescription ID).
    - Verifies the prescription details (medication, dosage, quantity).
    - Dispenses the prescribed medicine to the patient.

- Stock Deduction:
    - Once medication is dispensed:
        - The system automatically deducts the stock from the inventory.
        - Updates the current stock levels in real-time.
- Track Drug Dispensing History:
    - The system keeps a record of all dispensed medications for each patient, including:
        - Quantity dispensed.
        - Date of dispensing.
        - Pharmacist responsible.

5. Block Expired or Recalled Drugs

- Identify Expired Drugs:
    - The system tracks drug expiry dates and alerts the pharmacist when drugs are nearing expiration.
- Block Dispensing of Expired Drugs:
    - If a drug has expired, the system blocks dispensing and notifies the pharmacy staff. Expired drugs are removed from the available stock list.
- Recall Management:
    - If a drug is recalled by the manufacturer, the pharmacist can update the system to block dispensing of the recalled batch.
    - The system generates a list of patients who have received the recalled batch, and pharmacists can follow up to exchange or return the medication.

6. Manage Returns (Patient & Vendor)

- Patient Medication Returns:
  - Pharmacists handle returns of unused medication from patients (e.g., unopened packs or unexpired drugs). The system:
    - Records the return.
    - Updates stock levels accordingly.
- Vendor Returns:
  - The pharmacy may need to return damaged or unsold drugs to vendors. Pharmacists manage this process by:
    - Logging return details (drug, batch number, reason for return).
    - Updating stock levels once the return is processed.

7. Track Drugs Batch-Wise

- Track Batch Information:
  - The system tracks drugs batch-wise, recording key details like:
    - Batch number.
    - Manufacturing date.
    - Expiry date.
    - Supplier information.
- Monitor Stock Movement:
  - Pharmacists can view the movement of each batch (e.g., how much was dispensed, how much remains in stock).
- Generate Batch Reports:
  - Generate batch-level reports to monitor:
    - Stock levels of each batch.
    - Expiry dates of batches.
    - Movement of batches (dispensed, returned, etc.).

8. Generate Pharmacy Reports

- Sales Report:
  - Generate sales reports to track revenue generated by the pharmacy:
    - Daily, weekly, and monthly sales.
    - Revenue per drug category.
    - Top-selling medications.
- Expiry Report:
  - Generate expiry reports to track:
    - Drugs nearing expiry.
    - Expired drugs that need to be removed from stock.
- Stock Usage Report:
  - Generate stock usage reports that show:
    - How much medication has been dispensed.
    - Which drugs are in high demand and which are under-utilized.

9. Role-Based Access

- Manage Pharmacy Roles:
  - The system allows for role-based access control (RBAC):
    - Pharmacists: Full access to prescriptions, stock management, and reporting.
    - Pharmacy Technicians: Limited access, primarily for dispensing and managing stock.
    - Pharmacy Admin: Full administrative access, including updating the drug formulary, managing returns, and generating comprehensive reports.
- Configurable Permissions:
  - Admins can configure permissions based on roles, ensuring that only authorized personnel can perform sensitive tasks (e.g., pricing updates, stock adjustments).

10.Pharmacy Inventory & Compliance Management

- Inventory Management:
  - Pharmacists can track inventory levels, ensuring that stock is always replenished in time.
  - Automated stock alerts notify when inventory is low.
- Regulatory Compliance:
  - The system helps ensure compliance with pharmacy regulations by:
    - Tracking expired drugs and recalls.
    - Maintaining accurate records of drug dispensation and returns for audits.

Inventory & Purchase User Features (Web App)

1. Stock Register Management

- Maintain List of Drugs & Consumables:
  - The inventory manager or pharmacy staff maintains a list of all drugs and consumables used in the hospital. This list includes:
    - Drug name or item description.
    - Category (e.g., antibiotics, pain relievers, surgical supplies).
    - Quantity in stock.
    - Unit of measurement (e.g., mg, ml, box).
    - Expiry date of the item.
- Record Item Details:
  - Each item's detailed information is recorded and updated in the system:
    - Batch number.
    - Manufacturer details.
    - Supplier information.
    - Cost and price for accurate billing and financial tracking.

2. Stock In (Stock Addition)

- Add Stock Manually:
  - When new stock arrives, the inventory manager manually adds the items into the system. This includes:
    - Basic entries such as drug name, quantity, and batch number.
    - Supplier information and purchase price.
    - The system updates the inventory levels accordingly.
- Stock Validation:
  - The system validates that all necessary fields (expiry date, batch number) are filled and prevents the addition of incorrect or incomplete stock records.

3. Stock Out (Stock Deduction)

- Track Dispensed Stock:
  - When stock is dispensed to patients (e.g., through prescriptions or hospital usage), the stock level is reduced automatically in the system.
    - Pharmacy staff records the quantity dispensed and ensures it is deducted from the stock register.
    - For other consumables (e.g., surgical supplies), the system deducts stock when used in procedures or patient care.
- Track Usage for Billing:
  - As items are used, the system records the deductions and ensures the correct billing is applied to patients or hospital departments.

4. Expiry Tracking

- Show Soon-to-Expire Items:
  - The system automatically alerts when drugs or consumables are nearing their expiry date (e.g., within three months of expiry).
    - Items are listed in a “soon-to-expire” report for review.

- Prevent Use of Expired Items:
  - Once an item's expiry date passes:
    - The system prevents the dispensing or use of expired stock.
    - Expired items are automatically flagged in the inventory system, ensuring they are removed from active stock.
- Alerts for Expiry:
  - Pharmacists and inventory managers receive alerts about expired stock, enabling them to manage returns or dispose of expired items in compliance with regulations.

5. Low Stock Alerts

- Trigger Low Stock Alerts:
  - The system is configured to set minimum stock thresholds for each drug or consumable item (e.g., if stock falls below 10 units).
    - When the stock reaches this threshold, an alert is triggered to notify the inventory manager.
- Reorder Notifications:
  - The system sends reorder notifications based on low stock levels, allowing the inventory manager to place orders with suppliers before the stock runs out.
- Prevent Stockouts:
  - By providing early warnings, the system helps avoid stockouts, ensuring that critical medications and consumables are always available.

6. Reports Generation

- Daily/Monthly Stock Balance Reports:
  - The system generates daily and monthly stock balance reports, showing:
    - Current stock levels for all drugs and consumables.
    - Inflow and outflow of stock.
    - Inventory value (based on current stock and unit cost).

- Department-Level Consumption Reports:
  - Reports can be generated to show the consumption of drugs and consumables by department (e.g., pharmacy, emergency, surgery).
    - These reports help to identify high-demand items and assist with cost allocation across departments.
- Reorder History Report:
  - A reorder report tracks the history of past orders, showing when items were reordered, how much was ordered, and from which suppliers.
- Expiry & Waste Reports:
  - Reports are generated to track:
    - Expired items.
    - Wasted or returned goods, helping to ensure accountability and efficient stock usage.

7. Compliance & Audit

- Audit Logs:
  - The system maintains audit logs for all inventory actions, including:
    - Stock additions.
    - Stock deductions.
    - Expiry handling.
    - Stock returns and adjustments.
- Compliance with Regulations:
  - The system ensures regulatory compliance by tracking drug batch numbers, expiry dates, and supplier information. This is essential for ensuring that the hospital adheres to drug safety and quality standards.

8. Pharmacy User Role-Based Access

- Role-Based Access:
  - The system provides role-based access to ensure security and privacy:

- Pharmacy Manager: Full access to inventory management, stock reports, and purchase orders.
- Pharmacy Technician: Access to dispense medications, update stock levels, and track usage.
- Inventory Admin: Access to add, edit, and remove stock, manage suppliers, and generate reports.
- Financial Admin: Access to track costs, billing, and inventory value reports.

Billing and Payments User Features (Web App)

1. Login & Dashboard Access

- Login:
  - Staff responsible for billing (e.g., billing admin, cashier) log into the system with secure credentials and two-factor authentication (2FA) for additional security.
- Dashboard Overview:
  - Upon logging in, the user is presented with a dashboard providing:
    - Pending bills for patients.
    - Unpaid invoices and payment due dates.
    - Recent transactions and payment status (paid, pending, partially paid).
    - Notifications for incomplete payments, refunds, and insurance claims.

2. Generate Unified Bill

- Create Unified Bill:
  - The system generates a single, unified bill that includes all services provided to the patient, such as:

        - Consultation fees, medications, laboratory tests, imaging, and room charges.
        - Charges are automatically pulled from linked services (e.g., pharmacy, laboratory, imaging).
- Manual Addition of Charges:
    - In cases where manual charges need to be added (e.g., additional services), the user can manually add charges to the bill.
- Auto-Pull Charges:
    - The system automatically pulls charges from linked services like:
        - Doctor's fees.
        - Pharmacy charges for prescribed medications.
        - Lab tests and imaging charges.

3. Apply GST/Tax Automatically

- Automatic GST/Tax Calculation:
    - The system automatically calculates and applies GST/tax based on the total bill amount and applicable tax rates (e.g., standard, reduced tax for specific services).

4. Generate Receipts & Invoices

- Generate Unique Receipts:
    - Upon receiving payment, the system generates a unique receipt for each transaction, including:
        - Transaction ID.
        - Payment details (amount, date, payment method).
- Generate Printable & Downloadable Invoices:
    - Invoices are generated and made printable or downloadable (in PDF format), including:
        - Detailed breakdown of services provided.
        - Payment received.

        - GST/tax applied.

5. Audit Logs & Immutable Record-Keeping

- Immutable Audit Logs:
    - The system maintains immutable audit logs of all billing actions, such as:
        - Invoice creation.
        - Payments processed.
        - Manual charge additions.
        - Refunds or reversals.
        - This ensures accountability and transparency in the billing process.
- Exportable Audit Reports:
    - The audit logs are exportable for compliance audits or internal reviews.

6. Role-Based Permissions

- Enforce Role-Based Permissions:
    - Role-based access control ensures that only authorized personnel can:
        - Generate bills.
        - Process payments.
        - Issue refunds.
        - Update patient billing information.
- Admin/Manager Permissions:
    - Higher-level roles (e.g., billing manager) have access to approve refunds and reverse payments.

7. Manage Payments & Running Balances

- Advance Payments:
    - The system supports advance payments, where a patient can pay part of their bill upfront. These payments are tracked and deducted from the total balance.

- Running Balances:
  - The system maintains a running balance for each patient, reflecting:
    - Total charges.
    - Payments received.
    - Outstanding balance.

8. Refunds & Reversals

- Refunds:
  - The system allows for refunds to be processed for overpayments, returned items, or cancellations. Refunds are processed through an approval, requiring higher-level staff authorization.
- Reversals:
  - In case of errors (e.g., duplicate billing), the system allows payment reversals while maintaining an audit trail.

9. Bill Cancellation

- Prevent Bill Deletion:
  - To ensure data integrity, bill deletion is not allowed. Only cancellation is permitted, and this action is logged for auditing purposes.
- Cancel Bill:
  - If a bill needs to be cancelled (e.g., patient discharged without payment or billing error), the system marks the bill as cancelled and generates a corresponding cancellation receipt.

10.Multiple Payment Modes

- Support Multiple Payment Methods:
  - The system supports multiple payment methods to ensure flexibility:
    - Cash.
    - Credit/debit cards.

        - Online payment gateways (e.g., PayPal, Stripe).
        - Insurance (via direct claims or reimbursements).
- Payment Mode Tracking:
    - Each payment is tracked by its method, and receipts are generated accordingly.

11.Payment API Idempotency

- Ensure Payment API Idempotency:
    - The system ensures idempotency in payment processing, meaning that if the same payment request is made multiple times, it will only be processed once. This prevents duplicate charges and ensures payment accuracy.

12.Integration with Payment Gateways

- Payment Gateway Integration:
    - The system integrates with at least one payment gateway (Razorpay) to enable seamless online payments for patients.
        - Payment details are securely processed and recorded in the system.

13.Insurance & Patient Billing

- Bill Splitting Between Insurance & Patient:
    - The system supports bill splitting where part of the bill is paid by the patient and the remaining is covered by insurance.
        - Track insurance claims: The system tracks the status of insurance claims, ensuring that the patient's share is correctly calculated and billed.
        - Partial Insurance Approvals: The system supports partial insurance approvals, enabling patients to pay the remaining balance after the insurer has approved a certain amount.

14.Generate Billing Reports

- Collections Report:
  - Generate reports on the total amount collected for a specified period (e.g., daily, weekly, monthly).
- Dues Report:
  - Track outstanding balances and pending payments.
- Revenue Report:
  - Generate reports that show the hospital's total revenue based on the services rendered, payments collected, and billings processed.
- Discount Report:
  - Track applied discounts and promotions to monitor their impact on hospital revenue.

15.Printable & Downloadable Invoices

- Printable Invoices:
  - Once the payment is made, patients can print the invoice from the system or receive it through email/SMS.
- Downloadable Invoices:
  - Invoices can be downloaded as PDFs for easy storage and sharing with the insurance provider or for personal records.

Insurance & TPA User Features (Web APP)

1. Login & Dashboard Access

- Login: Insurance and TPA staff log in securely with credentials and two-factor authentication (2FA).
- Dashboard Overview: View pending claims, pre-authorization requests, and claim statuses.

2. Insurance Policy Management

- Maintain Insurance Policy Master:
  - Store and manage insurer details, policy information, and exclusions.
- Multiple Policies per Patient:
  - Support multiple insurance policies for each patient.

3. Claims Processing

- Pre-Authorization Requests:
  - Process pre-authorization requests, manage validity, and holds on approvals.
- Claim Submission:
  - Submit claims digitally or prepare export files for third-party processing.
- Track Claim Status:
  - Monitor claim lifecycle and track pending, approved, or rejected claims.
- Co-Pay & Deductibles:
  - Calculate and manage co-pays and deductibles.

4. Claim Approvals & Resubmission

- Manage Partial Approvals:
  - Handle partial claim approvals and track remaining amounts.
- Resubmission Form:
  - Support form for claim resubmission if needed.

5. Communication & Reporting

- TPA Communication Logs:
  - Maintain logs of communication with TPAs for audit and tracking purposes.
- Generate Insurance Reports:

    - Generate claims, approvals, rejections, and other insurance-related reports.
- Claim Expiry Alerts:
    - Send alerts for pending or expiring claims.

Reports and Analytics

1. Financial & Operational Reports

- Financial Reports:
    - Generate reports on collections, revenue, and outstanding dues.
- End-of-Day Settlement:
    - Generate daily settlement reports for reconciliation.
- Advance Reconciliation:
    - Track advance payments and reconciliations.
- Refunds & Discounts:
    - Generate audit reports on refunds and discounts.
- Operational Reports:
    - Generate reports on bed occupancy and turnaround times (TAT).

2. Insurance & Clinical Reports

- Insurance Reports:
    - Generate aging, claims, and approvals reports.
- Clinical Reports:
    - Track OPD/IPD statistics, admissions, and mortality.

3. Customization & Export

- Custom Report Builder:
    - Create custom reports based on specific criteria.
- Export Options:
    - Export reports in CSV, Excel, or PDF formats.

4. Scheduled Reports & Dashboards

- Scheduled Reports:
  - Set up automated report delivery via email.
- Dashboards:
  - View dynamic dashboards with drill-down filters for detailed insights.
- Audit Metadata:
  - Include audit logs in all reports for compliance tracking.

Blood Bank User Features (Web App)

1. Donor Registration & Screening

- Register Donors:
  - Blood bank staff register new donors and screen them for eligibility (e.g., age, health status).
- Record Donation Details:
  - Record essential donation details (e.g., donation type, volume, date).

2. Blood Component Inventory Management

- Maintain Inventory:
  - Track and manage the blood component inventory, including whole blood, plasma, platelets, etc.
- Cross-Matching:
  - Ensure compatibility by managing cross-matching tests for transfusion safety.

3. Transfusion Management

- Record Transfusions:
  - Record transfusion details and link them to the patient's ID for accurate medical records.

!

- Track Expiries:
    - Monitor expiry dates for each blood component and discard expired units to ensure safety.

4. Reporting & Access Control

- Generate Donor & Transfusion Reports:
    - Generate donor history and transfusion statistics for tracking donations and transfusion outcomes.
- Restrict Access:
    - Limit access to sensitive data to blood bank staff only, ensuring confidentiality and compliance.

Human Resource (HR) User Features (Web App)

1. Login & Dashboard Access

- Login:
    - HR staff log in securely with username/password.
- Dashboard Overview:
    - Access a dashboard with key HR metrics such as staff attendance, leave requests, and payroll status.

2. Staff Profile Management

- Maintain Staff Profiles:
    - HR manages detailed staff profiles including:
        - Personal information (name, contact).
        - Professional details (position, department).
        - License information (validity, expiry).

3. Duty Rosters & Shifts

- Manage Duty Rosters:
  - Create and update duty rosters and assign shifts to staff, ensuring proper coverage across departments.
- Track Attendance:
  - Monitor attendance using manual records or biometric systems for accurate tracking.

4. Leave Management

- Manage Leave Requests:
  - HR handles leave requests, including vacation, sick leave, and other types, and approves or denies based on availability.
- Leave Approvals:
  - Approve or reject leave requests with automated notifications sent to staff.

5. Payroll Management

- Process Payroll:
  - HR calculates and processes payroll, including salary, deductions, and allowances.
- Generate Salary Slips:
  - Generate salary slips for staff, detailing earnings, deductions, and net pay.

6. License Management & Alerts

- Track Expiring Licenses:
  - Keep track of licenses and certifications for staff, with alerts for expiry dates.

7. HR Analytics & Reporting

- Generate HR Reports:
  - HR generates reports on absenteeism, attrition, and overtime to monitor staff performance and trends.
- HR Analytics:
  - Analyze staff data for trends in leave utilization, overtime, and other key metrics for operational insights.

Super Admin Features (Web App)

1. Login & Dashboard Access

- Login:
  - Super admins log in with secure credentials.
- Dashboard Overview:
  - Access a central dashboard that provides:
    - Tenant overview (active hospitals, configurations).
    - Usage metrics (e.g., users, storage, API calls).
    - Platform health and SLA performance.

2. Hospital Management

- Manage Multiple Hospitals:
  - Onboard new hospitals (tenants) by configuring their accounts and providing access.
  - Offboard hospitals when they are no longer part of the system, ensuring data removal and access revocation.
- Tenant-Level Configurations:
  - Configure branding, tariffs, and modules specific to each hospital. This includes:
    - Hospital logo and theme.

        - Customized service pricing and module activation.

3. Usage Monitoring

    - Track Usage Metrics:
        - Monitor key metrics such as:
            - User activity (logins, actions).
            - Storage usage (documents, data).
            - API call volume (for integration purposes).

4. SaaS Billing & Subscription Management

    - Generate SaaS Billing:
        - Generate billing reports based on subscription plans and usage metrics.
            - Include details like subscription fees, overage charges, and usage-based fees.

5. Support & Escalation

    - Support Ticketing System:
        - Provide a ticketing system for tenants to report issues or requests.
            - Escalate issues based on severity or priority.
            - Track ticket status (open, resolved, escalated).

6. Feature Management

    - Enable Feature Toggles:
        - Enable or disable specific features for each hospital tenant, allowing custom configurations and access.

7. Platform Performance & SLA Reporting

    - Generate Performance Reports:

- Generate platform performance and SLA (Service Level Agreement) reports to ensure that the system is meeting uptime and service delivery expectations.
    - Track system availability, response times, and issue resolution times.
